

BUILDING STONES FOR USE IN DERBYSHIRE

The register below has been produced to assist those wanting to find sources of building stone for use in Derbyshire.

The County encompasses a wide variety of types of native stone. Carboniferous Limestone in the White Peak, Millstone Grit, a grainy sandstone in the Dark Peak and the central area, a finer sandstone on the Staffordshire border and on the opposite, eastern side of the County a soft sandstone found in association with the coal measures. The great Magnesian Limestone outcrop which crosses the length of Yorkshire and continues into County Durham starts just north of Nottingham and runs along the Nottinghamshire-Derbyshire border.

All these stones and numerous less significant local types have been used in Derbyshire for centuries and their particular characteristics have strongly influenced the native pattern of vernacular building and polite architecture.

Neither Magnesian Limestone nor Coal Measures Sandstone is any longer quarried for commercial building purposes within the County and alternative sources have to be drawn on.

Similarly, fissile sandstone or flagstone has not been quarried in Derbyshire for the production of roofing slates for many decades, although attempts are being made to re-open a few old quarries specifically for this purpose. These slates have been a major contributor to the vernacular building tradition of North Derbyshire for many years. For too long the only way to obtain traditional stone slates of the Derbyshire type has been through salvage. Companies and individuals who have carried out satisfactory work on stone buildings in Derbyshire can be found on the website of the Derbyshire Historic Buildings Trust: www.derbyshirehistoricbuildings.org.uk

There is growing recognition that quarrying for traditional building stone and slate is important to sustain sources of supply for locally distinct materials which are essential for the maintenance and repair of historic and traditional buildings. Such sources can also be important for maintaining supplies of materials for new development where it is important that this is in sympathy with the local and traditional built environment and landscape character. In a few cases, such operations represent the unbroken survival of an industry that has flourished from the Middle Ages.

The County is fortunate to be the home of the National Stone Centre, a registered charity, based at Middleton-by-Wirksworth. The organisation can carry out stone sourcing and matching and historical research relating to all sectors of the quarrying industry. The NSC has a library (accessible by prior appointment) covering geology, the minerals industry, minerals planning and a school resources section. It also has a large collection of geological material and photographs, and a small archive on quarry history: www.nationalstonecentre.org.uk

Derbyshire County Council does not accept any liability for the consequences of using the information contained in this website which is believed to be correct at the time of revision.
