

Using Intelligent Gully Cleansing Data to develop the bid

The council have now been using the Intelligent Gully Cleansing process for just over four years and have collected robust data from seven out of its eight district agencies, the last district awaiting the end of a long term contract following which the same Intelligent Gully Cleansing process will be adopted

Intelligent Gully Cleansing approach was developed as a consequence of the Council's Scrutiny Committee raising concerns over the economics of delivering an efficient service across the highway network. The processes were reviewed and coincided with significant advances in the capabilities of the Councils Single Asset Management System. An early pilot demonstrated the ease of operation and the quality of data collected and it was consequently rolled out to the three districts maintained by the Council under tendered contracts. Initial savings were approx. £100,000 for the three districts and further savings have accrued as the District Agencies have adopted the technology. A recent presentation to Scrutiny applauded the good work, the improvements across the highway network and the savings in administrative resource and cost of delivery. The data captured to date has supported monitoring the levels of detritus extracted from the gullies during their cyclic maintenance and adjusting the cleanse frequency to meet the demand. As a consequence we now have a range of cleansing frequencies from three months to three years. Where changes have been made these are monitored through; public enquiries, inspector observations and reactive cleanses to ensure the frequency meets the local cleansing requirements

The Intelligent Gully Cleansing process also provides data regarding the condition of the gully, frame grating and the status of the connection and surrounding carriageway construction. It is this data that has been used to identify the major maintenance / renewal of drainage assets subject of this Local Highways Maintenance Challenge Fund Tranche 2A bid submission

The following data identifies two defects

- dr-Blocked Broken Gully Connection
- dr-Gully dig out required

.. and it is the former that the bid seeks to address

The quantity of gullies identified as dr-Blocked Broken Gully Connection and requiring major maintenance or renewal of drainage assets on the Resilient and A road networks is indicated on the spreadsheet below and combined with the dr-Gully dig out required totals just over £10.8 million

£1.7 million of this, dr-Gully dig out required, is to be addressed through the current cyclic maintenance through the existing District Agency / Gully Cleansing Maintenance Contracts leaving £9 million where major maintenance or renewal of drainage assets is required

Derbyshire's bid concentrates on the dr-Blocked Broken Gully Connection defects and looks to address £2.5million of works approx. 636 gullies. Clearly there are more gullies requiring attention but the council has reservations on the ability to deliver more than the £2.5million within the required timescale. However should there be a some flexibility in the timescale then the council would be happy to accept an increased grant and could upscale the number of defective gullies and connections as required

Blocked / Broken Connection to be addressed through Phase 1 of the Local Highway Maintenance Challenge Fund Trance 2A
